HEADQUARTERS – 20,000 m²

FOR MORE THAN 40 YEARS

Timmer GmbH is your reliable partner in the area of pneumatics, vacuum technology as well as pumping and dosing technology. With more than 140 employees, we develop, manufacture and sell an extensive array of products at two factories - ranging from customised solutions through to technical accessories. In short: We offer you everything you need in your daily practice. Our products are known under the brand names Timmer und TIVAtec all over the world.

Basic vacuum terminology

Vacuum refers to a pressure that is lower than the pressure of the ambient air. In the technical context, frequently the term "percent vacuum" is used, where 0% vacuum is the normal atmospheric pressure of 101.3 kPa and 100% vacuum means a space that is completely free of air.

Underpressure is present in a system if its pressure is less than the atmospheric pressure.

Overpressure is present in a system, if the pressure is greater than the atmospheric pressure. In our catalogue we always use the term "% vacuum" which is standard in the industry.

The official physical unit is Pascal (Pa) (familiar from weather forecasts). However the units millibar (mbar) or Torr (Torr) are also used.

Suction

To generate vacuum in a tank, a portion of the air quantity must be extracted with the aid of a vacuum pump. To maintain a vacuum level of 50%, half the air quantity must be extracted. Depending on the industry, the air quantity extracted by the vacuum pump per time unit is referred to as suction, suction capacity, or suction air rate.

For our vacuum ejectors we specify suction in standard litres (i.e. norm litres) per minute (NL/min). For example 1000 NL/min means that the vacuum pump can remove 1000 litres of air or gas per minute from the system to be evacuated. Suction decreases as the evacuation time and vacuum level increase, because the air becomes ever "thinner".

Evacuation time

Here a time frame is meant, in which the vacuum system can be evacuated to a specific vacuum level. This capacity is referred to as evacuation time of the pump and it is normally specified is seconds per litre (s/l). If this value is multiplied by

The following always applies:

$$1\text{kPa} = 10 \text{ hPa} = 10 \text{ mbar} = 7.5 \text{ Torr}.$$

Due to the many possibilities of specifying the pressure, you must always pay close attention to determine precisely what is meant. The example below shows the interrelationships of the specific units of measure.

For example:

60% vacuum approximately equals:

$$-60 \text{ kPa}; 40 \text{ kPa}; -600 \text{ mbar}; 400 \text{ mbar}; 300 \text{ Torr}.$$

Do not confuse or compare the suction of vacuum ejectors with the suction of vacuum pumps. In general, the suction of electro-mechanical pumps does not allow a direct statement of how much air is removed from a vacuum system. But rather it refers to a (constant) theoretical value that arises from the cylindrical volume and the rotational speed.

Multi-stage vacuum pumps (ejectors)

The basic advantages of compressed air powered vacuum pumps (Venturi), such as compact size, low weight, simple set-up, wear-free and maintenance-free operation, are generally known.

Now however, the fact is that a single-stage Venturi, depending on the nozzle geometry, can achieve either a high final vacuum at low suction or high suction at a low vacuum level.

The technical restrictions of single-stage ejectors were ultimately overcome by multi-stage systems. The TIVAtec multi-stage ejectors have additional nozzle stages, which are arranged one behind the other. This enables a maximum volume flow with simultaneous low energy consumption and a high final vacuum. The intake air mixes with the compressed air and thus serves as a "free-of-charge propulsive jet". Although the rear nozzle stages no longer achieve the high underpressure level of the first stage, they do achieve a significantly higher suction, due to the enlarged nozzle cross section. And they do this with "zero energy consumption".

the volume of the system, you get the evacuation time for the desired vacuum level.

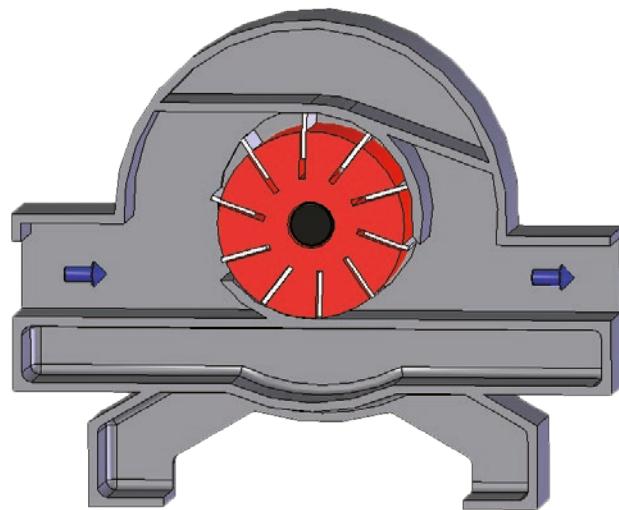

And at an extremely high suction, in order to also achieve a high final vacuum (>90%), the individual nozzle stages are separated from the common vacuum chamber by check valves.

This means, that when switching on the compressed air, all nozzle chambers are first connected to the common vacuum chamber. Due to the nozzle geometry, the last nozzle stage achieves a vacuum level of approximately 30%, for example. Due to the reduced cross section, each of the preceding nozzle stages achieves a higher vacuum level. As soon as the vacuum level in the common vacuum chamber is greater than the vacuum level that must be achieved in each of the individual nozzle stages, the respective check valve will be closed by the different pressure ratios.

Through use of special flow silencers, our multi-stage vacuum pumps are extremely quiet in operation.

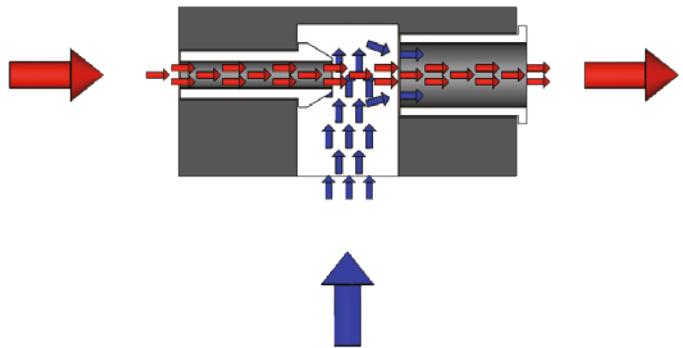

Characteristics of electro-mechanical pumps

- High suction
- High acquisition costs
- Heavy weight
- Large size
- High installation effort (costs)
- Maintenance-intensive (high costs)
- Cycle operation can only be realised by means of additional and expensive vacuum valves
- High noise level
- Heat generation
- Susceptible to wear
- Blow air with high thermal load
- Sensitive to contamination
- Long start and stop times
- Increased maintenance effort (costs for disposal of the waste oil)

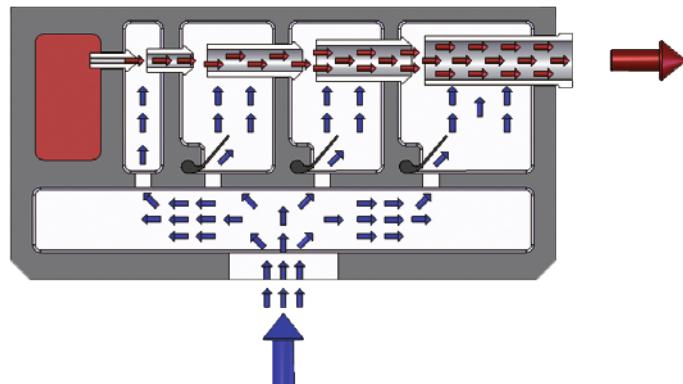

Characteristics of single-stage ejectors

- Relatively high compressed air consumption
- Low suction
- High noise level
- Compact design
- Low weight
- Low-cost acquisition
- Easy installation

Characteristics of multi-stage ejectors

- High suction
- High operational reliability
- Low weight
- Compact design
- Easy installation
- Low maintenance
- Simple cycling on the energy side
- Extremely responsive
- Low noise level
- Energy-efficient
- Virtually wear-free
- Relatively low compressed air consumption
- No rotating parts

Technical data

Advantages of our TIVAtec multi-stage vacuum pumps

Characteristic	Solution / explanation
High-efficiency	through the multi-stage principle
Low energy consumption	through optimal geometry. Energy consumption only when vacuum is required (cycling on the energy feed)
Abrupt build-up and release of the vacuum	Through the nozzle geometry and cycling of the energy supply (compressed air)
High operational reliability	No moving wear parts
Minimal maintenance requirements	Only clean compressed air and possibly a vacuum filter are required
Compact format, low weight	This means that the vacuum pump can be installed closer to the suction point and thus faster response times can be realised
Easy installation	Only the compressed air connection and the suction line must be installed. Any installation position is possible
Extremely quiet	Thanks to special design and use of flow silencers
No heat generation	Through expansion of the compressed air, a cooling effect occurs instead of heat development, which is the case with mechanical pumps
No vibration	The intake air is vibration free

L-characteristic

For the L-characteristic high suction at a relatively low vacuum level (approx. 70% max.) is the priority. They are particularly well-suited for handling porous

material, such as cardboard, and for large-volume vacuum generation, such as for mixers or in systems with fast cycles, where leakage must be compen-

sated in order to maintain the desired vacuum level.

M-characteristic

The M-characteristic is the "classic" among the nozzle systems, which are well-suited for most applications. Select the M-characteristic when you need

good suction, as well as a moderate to high vacuum level (max. approx. 90%). The M-characteristic is used for most of the industrial vacuum applications.

M...L characteristic

Optionally the M-characteristic can also be delivered as an M...L version. For this variant the nozzle geometry has been specially configured for low

operating pressures (approx. 3-4 bar) or fluctuating operating pressures. This means that the M...L version achieves its max. vacuum level (approx. 90%

max.) at a low operating pressure of 3-4 bar.

Options

Optionally all pumps can be delivered with an integrated check valve and FKM seals.

For example: UT-VP-MIN-M21L-R

All MIDI series pumps are likewise available with an energy-saving system. Through use of a pneumatic vacuum sensor and a valve in the compressed air supply, this system offers a cycling by an adjustable setpoint and thus reduces air consumption.

For example: UT-VP-MID-M26L-R-ES

MINI series

The MINI series consists of small, light-weight, multi-stage vacuum pumps that are used for robot handling tasks and automation tasks. These vacuum pumps offer compact dimensions, astounding suction and minimal air consumption as compared to conventional single-stage ejectors.

For each of these pumps we offer two standard characteristics:

- Characteristic L = high suction, moderate vacuum level and normal operating pressure 5-6 bar .
- Characteristic M...L = moderate suction, high vacuum level and normal operating pressure 3-4 bar .

Other characteristics, for an even higher vacuum, for example, are available on request.

MIDI series

The MIDI series vacuum pumps are offered as three-stage vacuum pumps in different sizes and with different characteristics. In spite of their compact size and low weight, MIDI series pumps are characterised by incredible power and are suitable for a variety of applications, either as an autonomous vacuum source or as the basic unit of a system for medium capacity requirements. This series can handle most vacuum tasks with no problems whatsoever; for many applications

the price-performance ratio of the MIDI series is quite favourable.

Here as well, for each of these pumps we offer two standard characteristics: Characteristic M = moderate suction, higher vacuum level and normal operating pressure 5-6 bar . Characteristic M...L = moderate suction, higher vacuum level and normal operating pressure 3-4 bar .

MAXI series

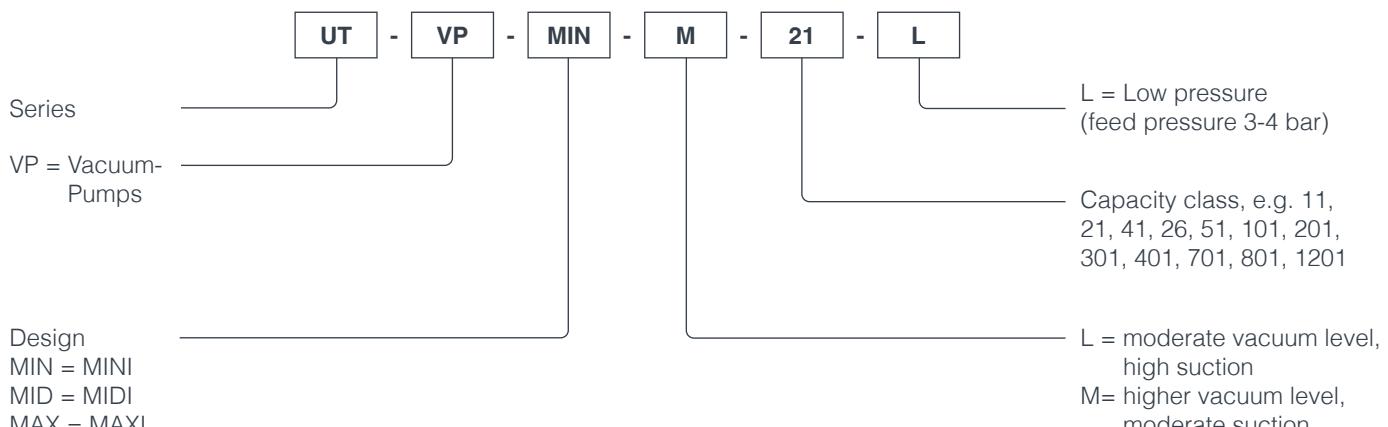

The application area of the MIDI series is concentrated on high suction or compensation for greater leakage. These vacuum pumps are 4-stage systems that deliver even better energy-efficiency at free intake and a low vacuum level. Starting with the UT-VP-MAX-M401, the MAXI series is normally delivered with compressed air and vacuum indicators, as well as an integrated valve and man-

ual switch. A silencer is integrated in the vacuum pump. Optionally exhaust air adapters for ducted exhaust air can be provided.

Characteristic M = moderate suction, higher vacuum level and normal operating pressure 5-6 bar .

*For hose lengths up to 2.5 metres

For optimal performance of the TIVAtec vacuum pumps

To ensure optimal performance of the TIVAtec vacuum pumps, the minimum hose diameters must be strictly complied with.

You can test for correct dimensioning of the hose as follows:

1. Compressed air line:

Connect the compressed air line and close off the vacuum connection with the compressed air switched on. The vacuum level must now reach the maximum value. If this is not the case, check the operating pressure directly preceding the vacuum pump with the compressed air switched on. With the vacuum pump switched on the nominal pressure (e.g. 6 bar) must not drop (decrease).

2. Suction line:

Connect the vacuum line and leave the end of the line open. With the vacuum pump switched on the vacuum level should not be more than 5 to 10%. For example, if 40% is applied, the first nozzle does not work and the evacuation time is extended. In this case, select a larger cross section for the suction line.

Vacuum pumps, type UT-VP-MIN-...

The MINI series consists of small, lightweight, multi-stage vacuum pumps that are frequently used for robot handling tasks and automation tasks.

The TIVAtec vacuum pumps offer compact dimensions, astounding suction, and minimal air consumption as compared to conventional single-stage ejectors.

For each of these pumps we offer two standard characteristics:

Characteristic L = high suction, moderate vacuum level and normal operating pressure of 5-6 bar

Characteristic M...L = moderate suction, higher vacuum level, low operating pressure of 3-4 bar.

Optionally available with check valve, FKM seals or energy-saving system.

Scope of delivery: Delivery includes silencer, threaded compressed air coupling and vacuum indicator.

Suction (NL/min) at different vacuum ranges (%)

Vacuum pumps type UT-VP-MAX-M...

The application area of the MIDI series is concentrated on high suction or compensation for greater leakage. These vacuum pumps are 3-stage to 4-stage systems that deliver even better energy efficiency, particularly at free intake and a low vacuum level.

Starting with the UT-VP-MAX-M401, the MAXI series is delivered with compressed air indicator and vacuum indicator, as well as an integrated valve and manual switch. A silencer is integrated in the vacuum pump. Optionally the MAXI series can be delivered with an exhaust air adapter for ducted exhaust air.

Characteristic L = high suction, moderate vacuum level and normal operating pressure of 5-6 bar

Characteristic M...L = moderate suction, higher vacuum level, low operating pressure of 3-4 bar.

Optionally available with check valve and FKM seals

TIVAtec vacuum ejectors

Plug-in ejectors – single-stage

Vacuum ejectors type UT-VP-SEJ-...

The TIVAtec vacuum plug-in injectors are small, compact vacuum generators. Thanks to their design, the ejectors can be used directly at the implementation area between compressed air line and suction cup.

Since they do not need any fastenings whatsoever, a complex installation is dispensed with. The suction of this series enables small, lightweight vacuum tasks, such as pick and place handling.

Vacuum pumps type UT-VP-RVA-M101-...

Our 3-stage, series UT-VP-RVA, TIVAtec vacuum pumps are impressive with their rounded design and superb performance data. The suction is up to 4.5 times the compressed air used. Thus these pumps are capable of generating a vacuum of up to 90%. Thanks to the use of high-quality and resistant materials (stainless steel 1.4301 and FKM) these vacuum pumps are particularly well-suited for use in conjunction with aggressive media in critical environments.

A version with clamp rings (see photo below) is available on request. These vacuum pumps are CIP-compatible, and thus there is no need to remove the vacuum generators. The cleaning agent is simply supplied from the vacuum side and exits the system on the exhaust air side.

Annular gap ejectors type UT-VP-RISPA-...

UT-VP-RISPA are suitable for all types of propellants and intake gases. The propellant is delivered into a mixing pipe diagonally to the inside in the flow direction by means of an outer annular gap. In this process the intake medium is carried along from the upstream side of the mixing pipe.

These annular gap ejectors are available with passages from Ø 10 to Ø 40 mm. The maximum vacuum is -15 to -80 kPa. Application areas include blowing in bulk materials and gases, mixing of gases, thread handling, as well as drying wire and pipe, as well as general use for blow-air generation and boost or multiplication through the intake air (e.g. for fan-pattern blowing, cooling or for process engineering).

The UT-VP-RISPA jet pumps are operated with propellants at a pressure from 0-6 bar. Intake capacity, mixing ratio, and maximum vacuum are adjusted depending on the intensity of the pressure. Moreover, the UT-VP-RISPA jet pumps can be freely adjusted via a threaded element. Thus vacuum as well as air consumption and mixing ratio can be regulated in a broad range. Our UT-VP-RISPA pumps are available in different materials, such as aluminium, stainless steel and high-temperature steel.

Annular gap ejectors type UT-VP-UTM-...

UT-VP-UTM are suitable for all types of propellants and intake gases. The propellant is delivered into a mixing pipe diagonally to the inside in the flow direction by means of an outer annular gap. In this process the intake medium is carried along from the upstream side of the mixing pipe.

These annular gap ejectors are available with passages from Ø 3.2 to Ø 9.5 mm. The maximum vacuum is -14 to -39 kPa. Application areas include blowing in / blowing out bulk materials, gases and dusts, mixing of gases, thread handling, drying wire and pipe, as well as general use for blow-air generation and boost or multiplication through the intake air (e.g. for fan-pattern blowing, cooling or for process engineering).

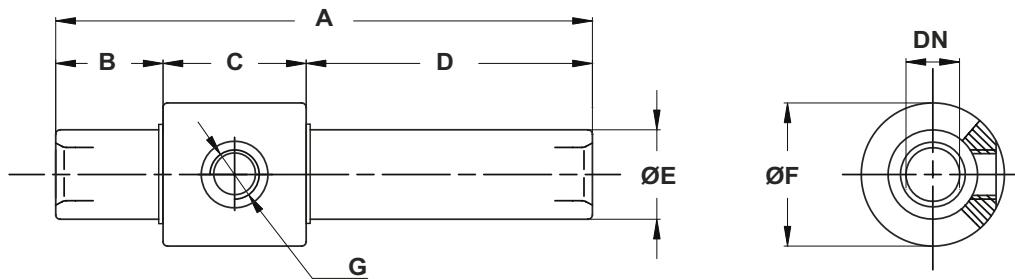

The UT-VP-UTM jet pumps are operated with propellants at a pressure from 0.2-6 bar. Intake capacity, mixing ratio, and maximum vacuum are adjusted depending on the intensity of the pressure. The UT-VP-UTM are not freely adjustable, however, vacuum, air consumption and the mixing ratio can be regulated via the pressure range.

Electric vacuum pumps

Rotary vane pumps as dry-runner pumps

These types of vacuum pumps are low maintenance and operate without lubricants. Thus it is not possible to contaminate the pumped medium. In addition, there are no treatment and disposal efforts expenses. The dry-runner pumps have a compact design and low weight. A vacuum of 88% can be achieved when evacuating closed containers. Pump cooling is ensured by an integrated fan. Therefore adequate ventilation must be ensured for the dry-runner vacuum pumps.

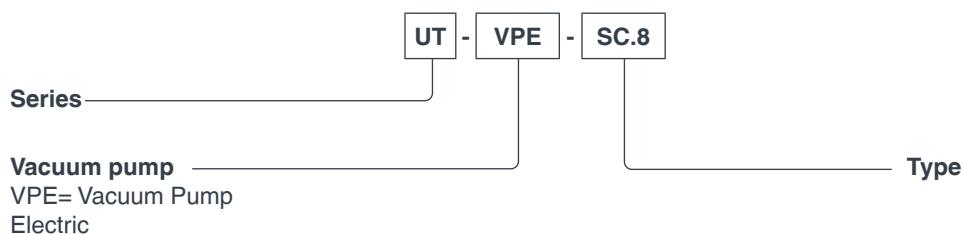

Rotary vane pumps – oil-lubricated

Thanks to their oil lubrication, these types of vacuum pumps offer a long service life and are reliable in continuous operation. They are characterised by constant high suction with a high final vacuum. With dense materials a vacuum of up to 99% can be achieved. These pumps are particularly suited for evacuating closed containers.

Vacuum blowers

These blowers are frequently used on porous materials, such as cardboard and particle-board panels. These compressors are characterised by a high suction, on the other hand the vacuum level is low. High-quantities of non-explosive gas/air mixtures can be pumped or high leak rates can be compensated.

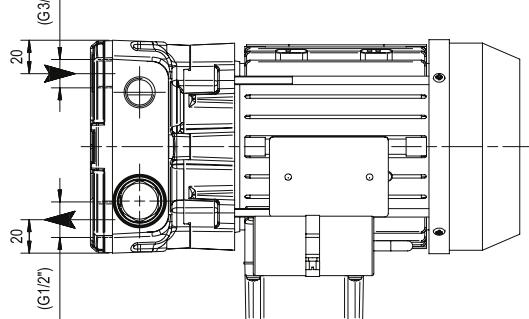

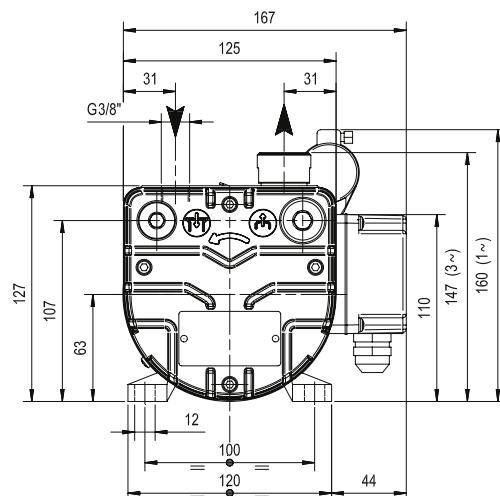

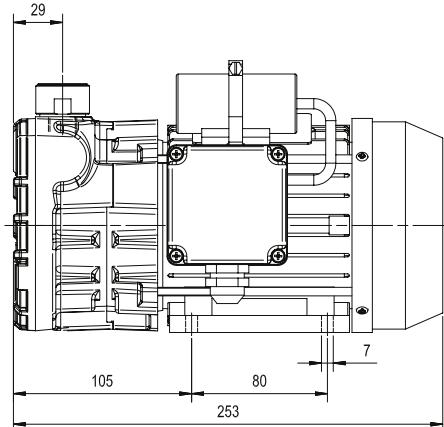

Type key explanation, e.g. type: **UT-VPE-SC.8**

Rotary-vane pumps type UT-VPE...

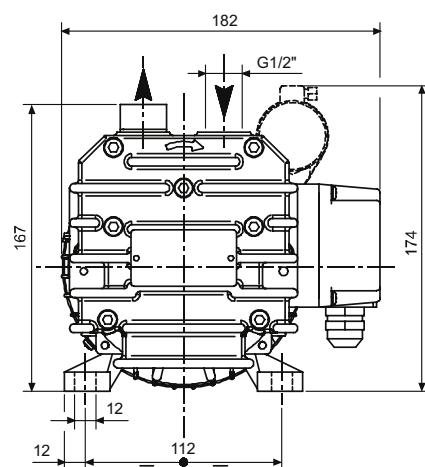

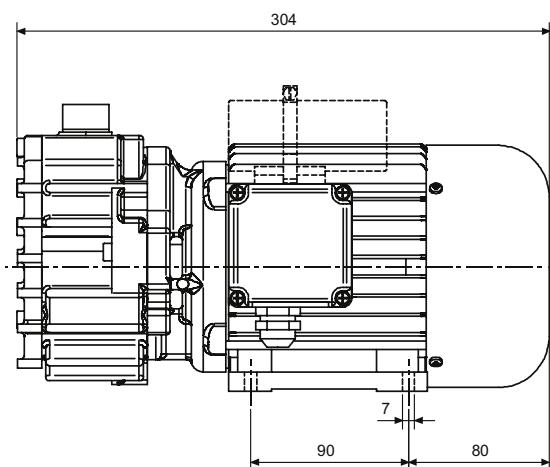

These oil-free rotary-vane pumps are manufactured in monoblock design. This means that the rotor is directly fastened on the motor shaft. Using this design the pumps are low weight with compact dimensions, which in turn makes it possible to install these rotary vane pumps where available space is limited. A lightweight metal alloy is used as the material. However, sufficient ventilation should be present. Pump cooling is ensured by an integrated fan.

Rotary vane pumps type UT-VPE SC...

The rotor is on a shaft supported by 2 bearings. The motor connection is established by means of an electric coupling. Cooling is ensured by a powerful fan between the motor and pump housing. This series is extremely compact, thanks to the stable protective housing. Moreover the sound pressure level is significantly reduced. These pumps require a 400 volt power supply.

TIVAtec – electric vacuum pumps oil-lubricated, 3-phase motor 400 volt

Rotary vane pumps type UT-VPE LB.8

For this series the compact dimensions and high final vacuum are the stand-out features. Oil fumes are prevented by a vaporisation and recovery system. A special sealing system protects against collapse of the vacuum. These pumps have an adjustable suction port. These pumps are specially suited for evacuating small closed containers. The UT-VPE-LC.12 is suitable for continuous operation in a pressure range from 400 mbar to 2 mbar.

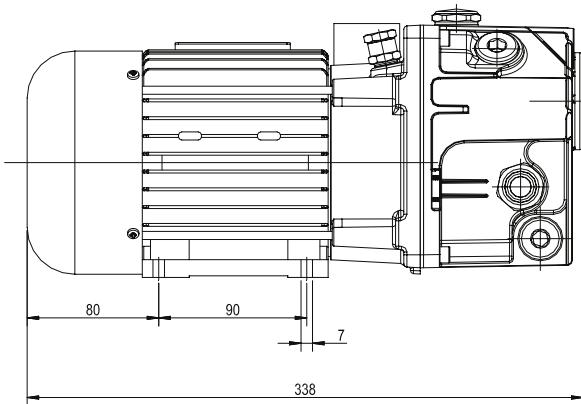

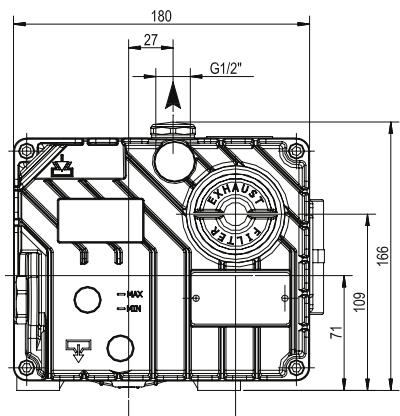

Order no.	Type	Suction m³/h	Vacuum level %	Motor power kW	Speed RPM	Suction port

UT-VPE-LC.12
Oil-lubricated

Rotary vane pumps type UT-VPE LC.20

A very compact design, low sound-pressure level, easy execution of inspection and maintenance tasks; all are characteristics of this vacuum pump. The exhaust air is free of oil fumes. This is achieved by the vaporisation and recovery system, which is equipped with a bypass and oil recovery valve. Also on the suction-side, the check valve prevents oil from flowing back, if the pump comes to a standstill under vacuum. This pump is particularly well-suited for evacuating small closed containers.

Suction cups

Application areas

Application areas for flat suction cups type UT-SN-F...

Flat suction cups are designed for use on level surfaces, when high holding forces are required. Due to the support ribs these suction cups offer minimal deformation and better positioning accuracy than universal suction cups. These suction cups are also ideally suited for horizontal applications.

Application areas for bellows suction cups type UT-SN- B...

Due to their design, bellows suction cups offer a lift function. They can be used on level surfaces and slightly arched surfaces. Likewise they offer the possibility of compensating position tolerances of the workpieces to be grasped.

Application areas for bellows suction cups type UT-SN- U...

Universal suction cups are particularly well-suited for use on level surfaces and slightly arched surfaces. These products offer better compensation of uneven areas than do flat suction cups.

Application areas for bellows suction cups long, type UT-SN- BL...

These bellows suction cups long offer an even better lift function than the bellows suction cups. However due to the many bellows, the suction cups are less stable. They are suitable for applications up to 60% vacuum.

Application areas for profile suction cups long, type UT-SN- P...

These suction cups are particularly suitable for rough surfaces, such as stone, concrete slabs, etc. The cellular rubber offers a good seal on many surfaces.

Application areas for oval profile suction cups long type UT-SN- OP...

These suction cups are particularly suitable for rough surfaces, such as stone, concrete slabs, etc. The cellular rubber offers a good seal on many surfaces. For tasks involving thin objects the oval shape increases stability.

Application areas for long suction cups with button valves, type UT-SN-...Tast

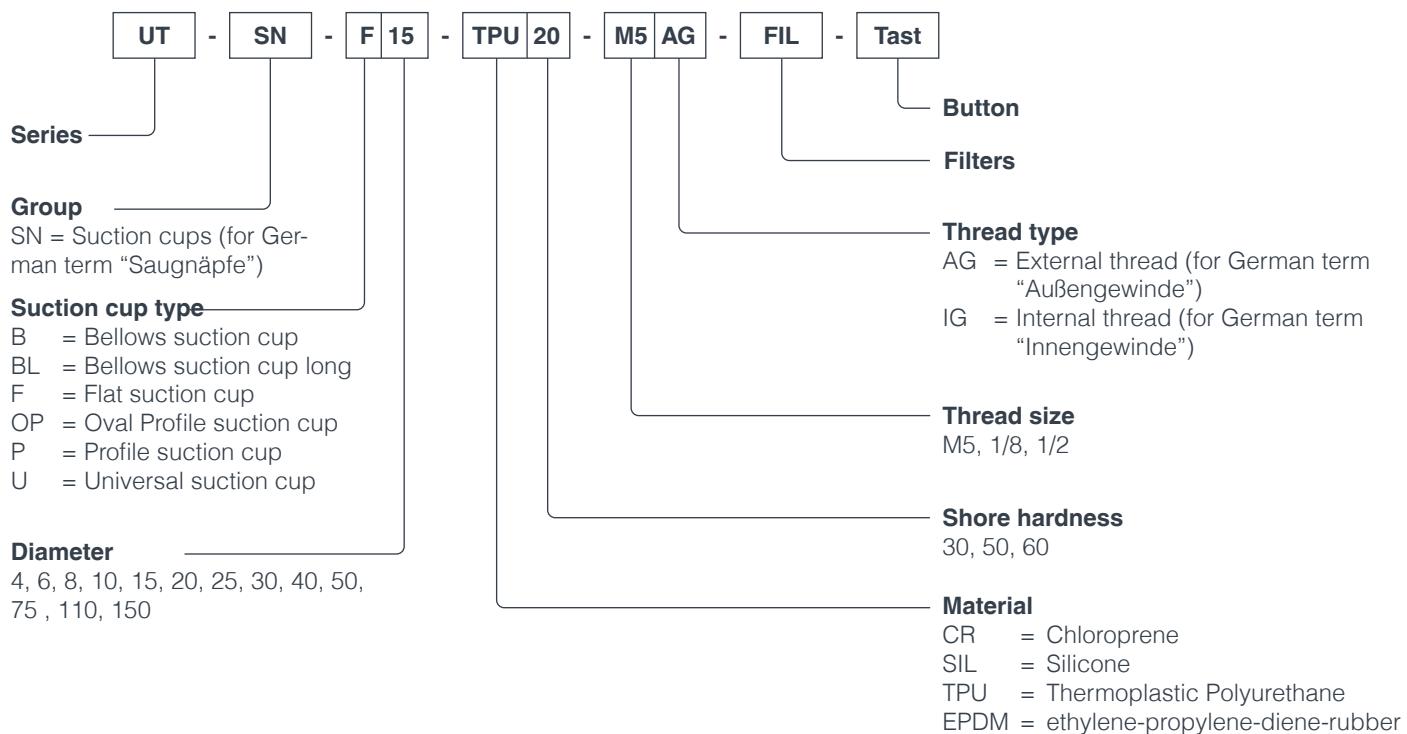

For applications with a central vacuum system and multiple suction cups, it can be effective to equip the suction cups with a push-button valve (German term "Tastventil"), so that the vacuum system does not take in any external air, if a suction cup does not rest correctly on the material to be handled. Thanks to the integrated button the valve is only opened when the suction cup rests correctly on the workpiece.

*The specified holding forces apply for dry sheet steel with a coefficient of friction of 0.5 μ and a safety factor of 1. Depending on the application, higher safety factors must be selected.

When selecting the appropriate suction cups, we recommend multiplying the weight that should be lifted by at least a factor of 2.

UT-SN-B110-1/2IG-FIL

UT-SN-B150-1/2IG-FIL

*The specified holding forces apply for dry sheet steel with a coefficient of friction of 0.5 μ and a safety factor of 1. Depending on the application, higher safety factors must be selected.

When selecting the appropriate suction cups, we recommend multiplying the weight that should be lifted by at least a factor of 2.

Temperature range

Chloroprene (CR)	:	-40 to +90 °C
Silicone (SIL)	:	-70 to +200 °C
TPU low impressions	:	-25 to +80 °C

Suction cups

Universal suction cups

Universal suction pads type UT-SN-U... with holder

Universal suction cups are particularly well-suited for use on level surfaces and slightly arched surfaces. These products offer better compensation of uneven areas than do flat suction cups.

Suction cups

Bellow suction cups long

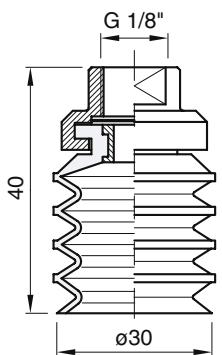

Bellows suction cups long, type UT-SN-BL... with holder

The "bellows suction cups long" offer an even better lift function than the bellows suction cups. However due to the many bellows, the suction cups are less stable. They are suitable for applications up to 60% vacuum.

Vacuums hose, H-S14

This hose is ideally suited as a suction and pressure hose for the vacuum area. The inner steel wire insert maintains the shape of the hose even at 100% vacuum, without pulling together. Series E hose connectors are mainly used for the threaded fittings.

Technical data

Operating pressure	: See table
Temperature range	: Up to max. 65 °C
Medium*	: Vacuum and fluids
Mech. characteristics	: Kink-resistant, completely vacuum-resistant, : resistance to ageing
Colour	Transparent, other colours available on request

*With the exception of typical pneumatic applications, the user must ensure the chemical and mechanical resistance of this item relative to the materials used, with due consideration of all factors, such as temperature, pressure, radiation, etc.
Timmer GmbH accepts no liability and offers no warranty if this instruction is not complied with.

Cap

Pneumatic type UT-ZUB-VS-PN...

Pressure switches are used to convert a specific, adjustable operating pressure into a pneumatic signal. When a set vacuum level is reached the switch releases a pneumatic signal for further processing.

For the pneumatic switches there is a distinction:

- NC: The 3/2-way pneumatic valve has no output signal without underpressure
- NO: The 3/2-way pneumatic valve has no output signal without overpressure

Order no.	Type	Thread	Flow rate (NL/min)	Signal range Vacuum (%)	Weight (g)

Electric type V-VS560-0.85-1-1/4-W

Including device plug, 4-pin DIN 43650 FORM A / changeover switch

This electric vacuum switch is mainly used in the rough vacuum area. It converts pneumatic signals into electric signals; the switching point is variably adjustable via an adjustment button. Likewise the V-VS560 has an integrated micro switch and thus can be used as NC contact, NO contact or changeover contact, depending on the connection. Optionally plug sockets with or without LED are available as accessories.

Dimensions

Digital precision pressure / vacuum switch

With the digital pressure switch, pressure signals or vacuum signals are relayed via an analog output or 2 PNP outputs. All parameters of the switch are adjusted via the front membrane keypad. The large display enables easy read-out.

When selecting the switch, in addition to the desired pressure adjustment range, also pay attention to the maximum permissible system pressure. Devices for special ambient conditions and higher system pressures and for other adjustment ranges or NPN switch outputs are available on request.

Features

- Extensive line of accessories
- Large display for easy read-out
- Easy, menu-driven adjustment
- 2-colour display (green LED: OUT1 / red LED: OUT2)
- Adjustable hysteresis
- Units displayed: MPa, psi, kgf/cm², bar, mmHg, InHg
- Adjustable switch output: Normally open (NO) or normally closed (NC)
- Analog output

Digital precision pressure / vacuum switch

This digital pressure switch relays pressure signals or vacuum signals via two digital outputs in addition one analog output is available. All parameters of the switch are adjusted via the front membrane keypad. The large display enables easy read-out. The values can be displayed in MPa, psi, kgf/cm² or bar.

When selecting the switch, in addition to the desired pressure adjustment range, also pay attention to the maximum permissible system pressure. Devices for special ambient conditions and higher system pressures as well as for other adjustment ranges or NPN switch outputs are available on request.

Features

- Two digital outputs
- Analog output
- Adjustable hysteresis
- High display accuracy
- Adjustable switch output NC contact or NO contact

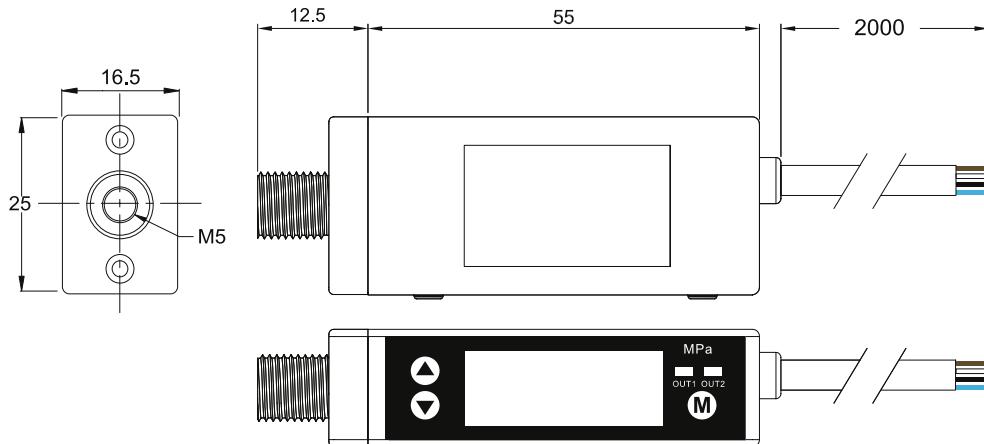

Order no.	Type	Signal range bar	Pressure port	Hysteresis	Weight (g)

Circuit diagram

Pressure and vacuum switches

Pressure switches are used in line systems with gaseous media. When a set pressure is reached the switch releases an electrical signal for further processing.

When selecting the switch, in addition to the desired pressure adjustment range, also pay attention to the maximum permissible system pressure. Devices for special ambient conditions and higher system pressures and for other adjustment ranges or NPN switch outputs are available on request.

Features

- Connection for push-in fitting
- Compact design
- Simple operation

Order no.	Type	Signal range bar	Function	Weight (g)
25014274	V-DS-KP101-4/-1-D6-S-2m	-1 to 4	NO contact	20

General technical data

Pressure port	Current consumption	Electrical connection	Medium	Operating voltage	Operating temperature
Ø 6 mm	<55 mA	2-wire cable (2 m)	Air	12-24V DC ± 10% ripple	0°C to + 60°C

Pressure adjustment

Use a flat-blade screwdriver to adjust the pressure switch via the trimmer.

Turn clockwise to increase the pressure setpoint.

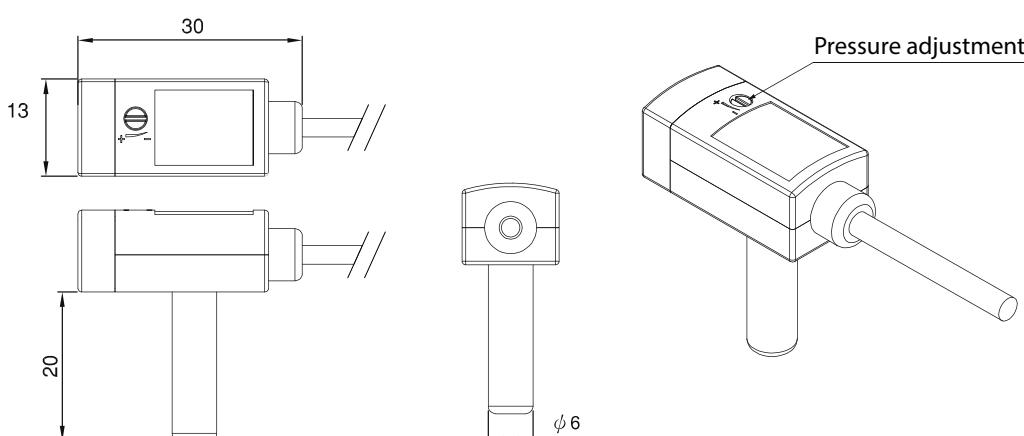

Turn anticlockwise for vacuum settings.

A stop on each side ensures that the trimmer cannot be turned beyond its limit value. Turning the adjuster beyond the limit value can damage the adjuster.

Pressure / vacuum switches

Vacuum switches are used in line systems with gaseous media. When a set vacuum pressure is reached, the switch releases an electrical signal for further processing.

When selecting the switch, in addition to the desired pressure adjustment range, also pay attention to the maximum permissible system pressure. Devices for special ambient conditions and higher system pressures and for other adjustment ranges or NPN switch outputs are available on request.

Features

- Small, compact design
- Fast response time: 5 ms
- Switch point display via LED
- Hysteresis can be adjusted from 1-10% of the measured value

Order no.	Type	Signal range (bar)	Pressure port	Operating temperature	Weight (g)
25014271	V-VS-KP11-1/0-1/8-PNP	-1 to 0	G1/8"	0°C to +50°C	50
25014273	V-DS-KP12-0/10-1/8-PNP	0 to 10	G1/8"	0°C to +50°C	50

General technical data

Repeat accuracy	Medium	Response time	Electrical connection	Operating voltage	Protection class
±1%	Air, non-flammable gases	5 ms	3-wire cable (1 m)	12-24V DC ± 10% ripple	IP 40

Pressure and hysteresis adjustment

Use a flat-blade screwdriver to adjust the pressure switch via the trimmer.

Turn clockwise to increase the pressure setpoint.

Turn anticlockwise for vacuum settings.

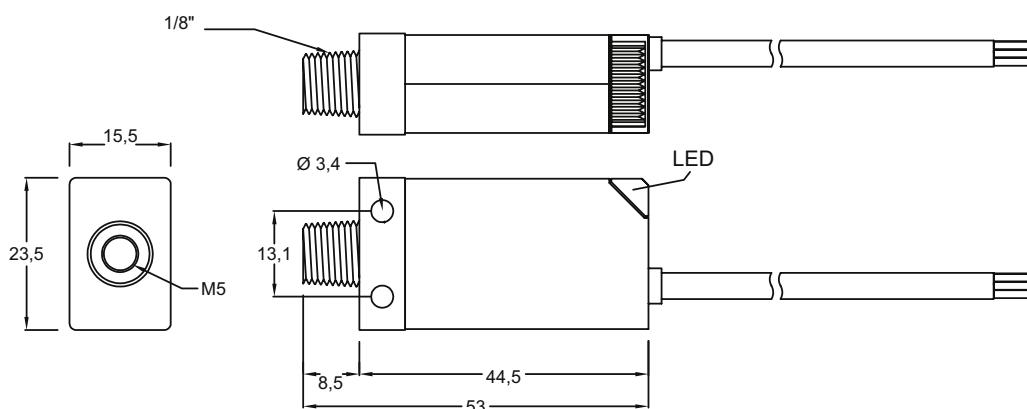

The setpoint for the hysteresis is also set with a screwdriver.

The rotation angle of the trimmer is 220°.

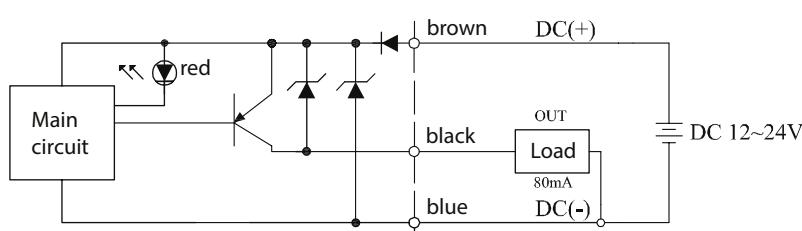

A stop on each side ensures that the trimmer cannot be turned beyond its limit value. Turning the adjuster beyond the limit value can damage the adjuster.
